

OFFLINE

T-SIM features
fit $d(\mathbf{z})$

V-SIM-Cal labels
fit conformal radii

INFERENCE

Speech
 $\mathbf{x}$

Frozen predictor
 $\hat{q} = f(\mathbf{x})$
 $\mathbf{z} = \phi(\mathbf{x})$

Distance score
 $d(\mathbf{z}) \rightarrow Q(\mathbf{x})$

Interval
 $[\hat{q} - Q, \hat{q} + Q]$

Tested hypothesis: does $d(\mathbf{z})$ rank prediction error well enough to choose an utterance-specific radius?
